Abstract

In Bangladesh, nowadays, a large number of people are diagnosed with diseases like Cancer and Thyroid malfunction and many are treated through the use of atoms. Nuclear medical technologies have revolutionized diagnostic services owing to their accuracy. The National Institute for Nuclear Medicine and Allied Sciences (NINMAS), through several centers, is providing various nuclear medicine services throughout the country. The institute is an establishment of the Bangladesh Atomic Energy Commission (BAEC) under the Ministry of Science & Technology of the government NINMAS and BSMMU offer diagnosis, treatment and concurrently conducts research and development activities [1]. With the integration of computer science have the potential to enhance the treatment, research and diagnosis of the nuclear medicine sector making it more accurate, precise, efficient and time-saving, specifying in revolutionizing healthcare delivery for patients in Bangladesh to give bettermedical services through nuclear medicine at low cost, regardless of any economic background.

Introduction

With the advancements in technology and a subtle urge to make Bangladesh digitalized, computer scientists can come forward to boost the advancement of the nuclear medicine sector aiming at prioritizing affordable healthcare for all the general people of Bangladesh can be achieved in an optimized way. Our objectives in this article are to integrate the topics of nuclear medicine and computer science and discuss the ideas where computer science can help in nuclear medicine in revolutionizing a better healthcare service at the doorstep of patients at low cost and to reduce the waiting process focusing the point as patients in Bangladesh still can't be provided with seating facilities, they have to wait a long time to get services.

Nuclear medicine or nucleology is a medical specialty involving the application of radioactive substances in the diagnosis and treatment of disease [2]. Nuclear medicine uses radioactive material inside the body to see how organs or tissue are functioning (for diagnosis) or to target and destroy damaged or diseased organs or tissue (for treatment) [3]. Some types of Nuclear Medicine (Proven Radiology Procedures in New Jersey) are: Bone or Joint Scan, Gallium Scan, Gastric Emptying, Liver or Spleen Scan, MUGA Scan etc. [4]. Nuclear medicine is described by three elements - clinical problem, the radiopharmaceutical and the instrumentation [5].

Bangladesh, a developing county, has a rich history of nuclear medicine in the sectors of research, diagnosis and treatment, breaking down barriers to nuclear medicine. Starting the journey from a tin shed 'Radioisotope Center' in 1962, Bangladesh now has 20 NM centers with 3 PET-CTs, 42 gamma camera/SPECTs having 95 NM physicians, 20 physicists, 10 radiochemists and 150 technologists and it's still advancing. The National Institute of Nuclear Medicine and Allied Sciences (NINMAS) in Dhaka is by far the largest NM facility in the country. Bangladesh didn't stop staying within the boundaries but the

country has also maintained an international relationshipwith ARCCNM, AOFNMB, ASNM, WFNMB and WARMTH for a coordinated approach to development[6]. Bangladesh is building a nuclear medicine system with well-trained medical staff, advanced imaging tools and a cost-effective source of essential radiopharmaceuticals. The number of people who can affordably access diagnostic medical care in Bangladesh has increased three times over the last ten years, as the country has expanded and strengthened its nuclear medical services [7].

The rapid growth in the capability of computers has implications for the management of a nuclear medicine department. it focuses on the phenomenal increase in computing capabilities, storing images on a computer, image processing, data acquisition, file format and information system [8]. In the History of nuclear medicine through the eyes of computers, the excellent anatomic details of central nervous system (CNS) disease provided by computerized transaxial transmission tomography emphasizedthe limited ability of nuclear imaging to assess morphology. The greatest impact has been seen in cardiovascular nuclear medicine. The effects of improved computer algorithms have had an impact on the analysis of data obtained from numerous radioisotope studies. Computers have also been used in nuclear medicine to perform administrative functions, like data reporting and retrieval. The data organization and retrieval functions of computers are also quite useful for in vitro operations where hundreds of samples are counted nearby. Computers have also been used for programmed instruction of nuclear medicine technologists and physician trainees, and have even been used to "interpret" digital organ images [9].

Enhancing Nuclear Medicine Practices with Computer Science Technologies in Bangladesh

The first and foremost sector that Bangladesh needs to focus on is creating an effectively managed and analyzed database containing all the patient's information for priority order and further research purposes. They can get ideas and study the data structures that maintain NUclear Medicine DAtaBase (NUMDAB), an information resource on the status of nuclear medicine practice worldwide [10]. Understanding the current state of infrastructure, technology and educational resources for implementing nuclear medicine practice, training and research the development of efficient databases, data analytics, effective data mining techniques is mandatory for the extraction of valuable insights from the data to execute patient's treatments quickly and further purpose also.

Computer science needs to be used to enhance and analyze medical images obtained from nuclear medicine procedures. One of the major parts of nuclear medicine is image processing, and with the aid of computers and ADC system converters digital image processing, the use of algorithms and mathematical models to process and analyze digital images. The goal of digitalimage processing is to enhance the quality of images, extract meaningful information from images, and automate image-based tasks [11]. In digital image processing the sectors mentioned need to be explored focusing on the enhancement of image acquisition, reconstruction analysis in nuclear medicine, the development and utilization of

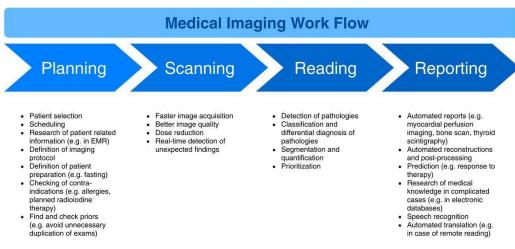

advanced machine learning algorithms, AI-driven tools and technologies and integration of computeraided detection systems to assist radiologists for automated image analysis and detection of abnormalities, advanced imaging systems, such as hybrid modalities and molecular imaging techniques for achieving quick and accurate diagnosis and treatment purpose. Innovative imaging techniques, such as low-dose protocols and novel data processing algorithms, reduce radiation exposure without compromising diagnostic accuracy, safeguarding patient safety whileminimizing associated costs.

Telemedicine is a sustainable and optimized solution for ensuring initial procedures for rapid treatment. Telemedicine refers to the provision of remote clinical services, via real-time two-way communication between the patient and the healthcare provider, using electronic audio and visual means [12]. Bangladesh has advanced in telemedicine services, remote healthcare and consultation isn't a difficult job now. Here telecommunication engineering comes in handy. This solution is effective in rural areas where healthcare services are limited. Gathering efficient information prioritizes the treatment of patients in order of emergency level if real-time patient monitoring is ensured.

The utilization of computer science enhances radiation dosage optimization in nuclear medicine treatments to gain precise diagnostic or therapeutic dosages focusing on minimizing potential risks. The importance of creating algorithms and software tools for achieving precise dose calculation and optimization is worth mentioning.

Proper utilization of computer-based simulations and modeling techniques can ensure an optimized treatment plant to reduce side effects. The enhancement of computerized systems to ensure the precision and effectiveness of radiation therapy in nuclear medicine can be an effective solution. AI-baseddecision support systems can help doctors while conducting the proper steps of treatments and maintaining medical ethics.

In the field of medicine, in particular, medical imaging, the hype of recent years about artificial intelligence (AI) has had a significant impact. The following figure explains the sectors in medicalimaging that can be explored:

Division of medical imaging Work Flow into 4 steps: planning, image acquisition, interpretation(reading), and reporting. Each step is assigned a list with examples of typical tasks that could be performed in that step and could be improved, accelerated, or completely automated with the help of AI[13].

<u>Chalangs</u>

Discussing all the probable sectors and possible ways to contribute to nuclear medicine via computer science in the medical sectors of Bangladesh, challenges and drawbacks remain evident. The bridge between computer science and nuclear medicine is still quite fragile. We can't overlook the challenges that can hinder the advancement of nuclear medicine with the aid of computer science as inadequate facilities remain in this developing country. One of the biggest problems we need to overcome is limited infrastructure and inadequate resources for example the need for high-performing computing systems (supercomputers), advanced imaging equipment etc. These sophisticated types of machinery can't be afforded still in root-level medical and research institutions. The challenge professionals in the field are facing is two-fold. On the one hand, there is a scarcity of trained manpower. On the other, the population is growing. While international standards recommend operating one radiotherapy machine perone million inhabitants, Bangladesh still has only 24 machines for its population of 166 million [14]. Dr Nafisa Zahan, director of Inmas in Barishal, says "The number of our patients has increased a lot compared to before. An average of 150 patients come daily for treatment. Patients can't be provided with seating facilities, they have to wait a long time to get services." [15]. Lack of financial support or governmental aid in research and development projects due to corruption, inertness in systems hinders the technical, theoretical, practical and analytical progress in each sector. Bangladesh though advancing in IT sectors still faces a technical expertise gap in simulation and imaging sectors still faces a shortage of skilled computer engineers, data scientists and imaging experts. High expenses, maintenance costs of computer systems, software, and specialized training are significant financial challenges for nuclear medicine specialized healthcare institutions. While diagnosing numerous patients the need for an optimized data management system is still seen evident. When a researcher wants to research a numerical database basis the problem always rises first.

Solutions to Overcome the Challenges

Investments in infrastructure, education, and training programs will further strengthen the integration of computer science in nuclear medicine and its affordability in Bangladesh. The government has taken the initiative to install modern equipment and develop infrastructure at the country's five nuclear medicine institutes to cope with the growing number of patients. It will help common people outside Dhaka get an opportunity for diagnoses and treatment of some complex diseases, through nuclear medicine at low cost. In addition, the diagnostic capacity of the institutes will increase and the patient control system will

improve. The Institutes of Nuclear Medicine and Allied Sciences (Inmas) will be modernized at Mitford, Cumilla, Faridpur, Barishal and Bogura at a total cost of Tk216 crore. The Bangladesh Atomic Energy Commission will implement the project by 2025. In the proposed development project proposal, known as DPP, Tk122 crore has been earmarked for the purchase of foreign equipment, which is 56.37% of the total project cost. Another Tk18 crore has been proposed for the purchase of local machinery, which is 8.63% of the total project cost [15]. While tackling the challenges in the sector of cost and affordability, computer science is itself the solution. Bangladesh still faces a shortage of manpower, including doctors, against the number of sanctioned posts in the sector of nuclear medicine. The first and foremost duty to ensure skilled manpower is education and training. But nuclear medicine in practical training isn't free from risks as it is associated with isotopes and radiation. Also providing medical training centers are expensive, mentioning maintenance of the pieces of equipment, machines etc. As a developed country like Bangladesh in the era of digitalization providing interactive educational tools, virtual environments and simulation software for educational and training purposes can minimize the cost, and risks while doing practical training and a skilled workforce can be ensured. Academic institutions, healthcare providers, technology companies, and the government should foster partnerships to drive research, development, and implementation of computer science solutions. Emphasizing the requirement of a powerful database management system for storing, managing and analyzing numerous patient data is a demand while diagnosing patients along with constant monitoring to avoid the leakage of these data. The simultaneous working of cybersecurity and database sectors is a must need while handling the huge amount of databases.

Conclusion

Such a vast topic like nuclear medicine has a rich history even in Bangladesh, its importance in the medical sector can't be bounded in limited words. Despite all the challenges Bangladesh is still fighting against all odds to get the solution to provide efficient treatment to the general people by delivering at the doorsteps of the country's people at low cost. Here computer science can be revolutionary to make the treatment low-cost and research fast-paced. Computer science will give enhancement the efficiency of research, diagnostic and treatment sectors. As a matter costing is extremely important for people in Bangladesh. If Bangladesh can't provide subsidized care many people would not be able to get the care they need.
